How?

Goal of this talk is to provide practical guidance **how** to share data products from automated *in situ* observations of plankton, with a focus on standardizing data

<https://tinyurl.com/sharing-HAB-data>

Why?

F
Findable

A
Accessible

I
Interoperable

R
Reusable

<https://www.go-fair.org/go-fair-initiative/>

[Image CC-BY Sangya Pundir](#)

How? Ocean Best Practices Repository

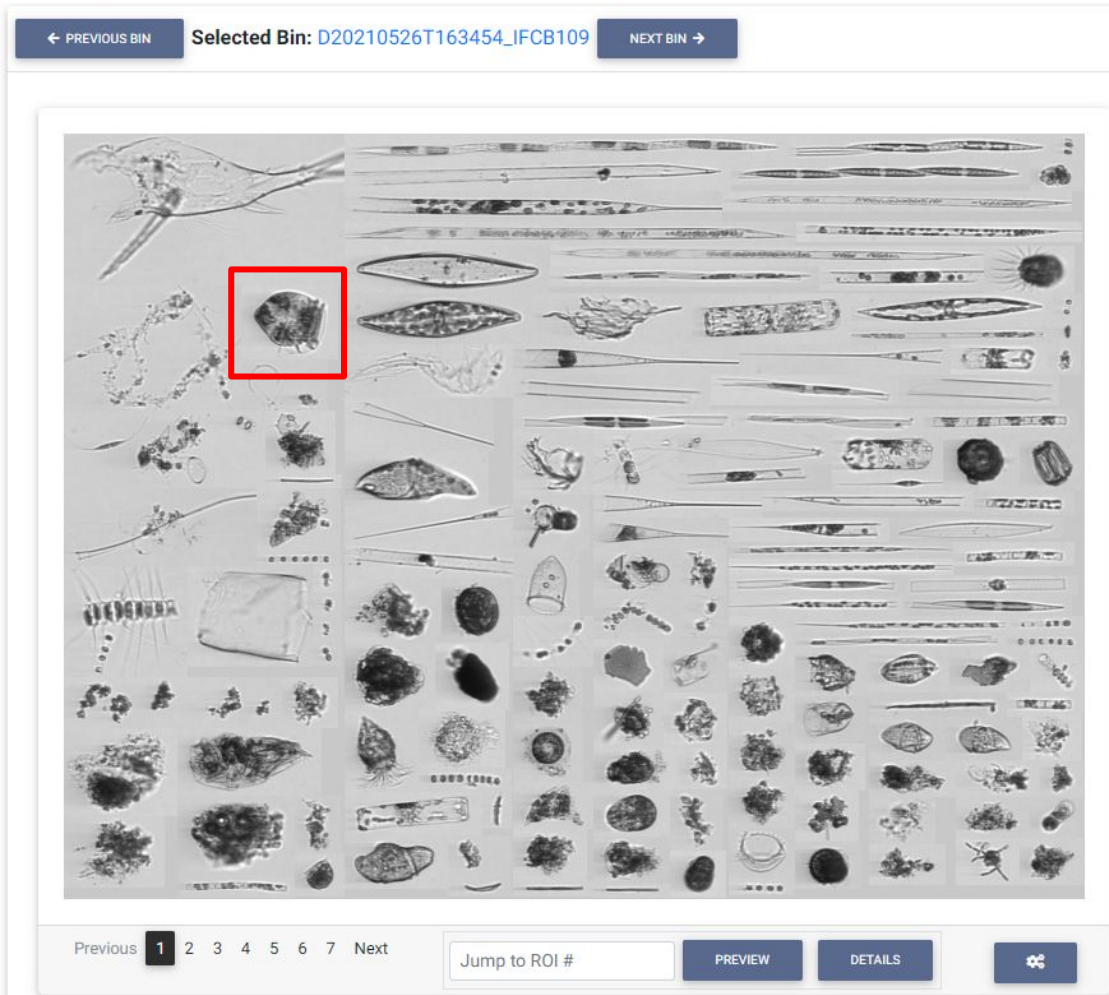

<https://www.oceanbestpractices.org/repository/>

- [Neeley, A., et al. \(2021\)](#) Standards and practices for reporting plankton and other particle observations from images. Technical Manual. Ocean Carbon and Biogeochemistry Project Office.
- [Martin-Cabrera, P., et al. \(2022\)](#) Best practices and recommendations for plankton imaging data management: Ensuring effective data flow towards European data infrastructures. Version 1. JERICO-S3 project.
- [Horton, T., et al. \(2021\)](#) Recommendations for the Standardisation of Open Taxonomic Nomenclature for Image-Based Identifications. *Front. Mar. Sci.*

* discussion planned for Thursday

Example: Images from Imaging FlowCytobot (IFCB)

https://ifcb-data.whoi.edu/timeline?dataset=NESLTER_broadscale&bin=D20210526T163454_IFCB109

Let's look at a common workflow *

Autoclassifier to assign preliminary label per image

Manual annotation to verify auto-label or assign other label (with greater certainty)

Standardize to a taxonomic database (may prefer higher taxonomic rank for certainty)

Further standardize data/metadata to share with a community data repository

* note that Bengt showed 'Data flow and production of classifiers' in talk earlier today

Why standardize to a taxonomic database?

[Image CC-BY CindyLouPhotos](#)

Why standardize to a taxonomic database?

Table 2. Old and recent names of phytoplankton and zooplankton.

Old name	Recent name
<i>Dactylococcopsis raphidioides</i>	<i>Monoraphidium contortum</i>
<i>Gomphosphaeria</i> sp.	<i>Snowella</i> sp./ <i>Woronichinia</i> sp./ <i>Gomphosphaeria</i> sp.
<i>Oscillatoria agardhii</i>	<i>Planktothrix agardhii</i>
<i>Oscillatoria limnetica</i>	<i>Pseudanabaena limnetica</i>
<i>Lyngbya limnetica</i>	<i>Planktolyngbya limnetica</i>
<i>Cyclotella laevissima</i>	<i>Cyclotella meneghiniana</i>
<i>Rhizosolenia minima</i>	<i>Chaetoceros minimus</i>
<i>Euglena</i> spp.	<i>Euglena</i> spp. and/or <i>Eutreptiella</i> spp.
<i>Richteriella botryoides</i>	<i>Micractinium pusillum</i>
<i>Tintinnopsis relict</i>	<i>Tintinnopsis fimbriata</i>
<i>Brachionus pala</i>	<i>Brachionus calyciflorus</i>
<i>Triarthra longiseta</i>	<i>Filinia longiseta</i>
<i>Anuraea</i> spp.	<i>Keratella</i> spp.

[Finni, T., et al. \(2001\)](#) *AMBIO: A J. of the Human Environment*

Why standardize to a taxonomic database?

[Image: Public domain](#)

How? Standardize to a taxonomic database

- **Select a taxonomic database used by your community**
 - [World Register of Marine Species \(WoRMS\)](#) used by UNESCO's Harmful Algal Information System and Global HAB Status Report
 - IOC-UNESCO Taxonomic Reference List of Harmful Micro Algae
<http://www.marinespecies.org/hab/index.php>
- **Community data repository may require or recommend a particular taxonomic database**
 - WoRMS is required by [Ocean Biodiversity Information System \(OBIS\)](#)
 - OBIS HAB node
<https://obis.org/node/33dec23c-af65-4fb1-a437-79543c562ef0>

How? Standardize to a taxonomic database

- **Provide name from taxonomic database:**
 - e.g., you can use [WoRMS Taxon Match Tool](#)
- **Provide the paired identifier and/or kingdom:**
 - so that automated tools can ‘check’ against names that are in multiple branches of the tree of life
- **Retain your original label:**
 - often is a more descriptive name for a morphospecies

How? Standardize to a taxonomic database

- **Provide name from taxonomic database:**
 - [scientificName](#)
- **Provide the paired identifier and/or* kingdom**:**
 - [scientificNameID](#) , and/or*
 - [kingdom**](#)
- **Retain your original label:**
 - [verbatimIdentification](#)

* [OBIS requires](#) scientificNameID

** Global Biodiversity Information Facility ([GBIF](#)) [recommends kingdom](#)

How? Further standardize to share with repository

- The specific terms on previous slide are from the [Darwin Core standard](#), used by Ocean Biodiversity Information System (OBIS) and the Global Biodiversity Information Facility (GBIF)

How? Further standardize to share with repository

- **Report whether an automated identification has been verified:**

- [identificationVerificationStatus](#)

- PredictedByMachine, or
- ValidatedByHuman

[Martin-Cabrera et al. \(2022\)](#)

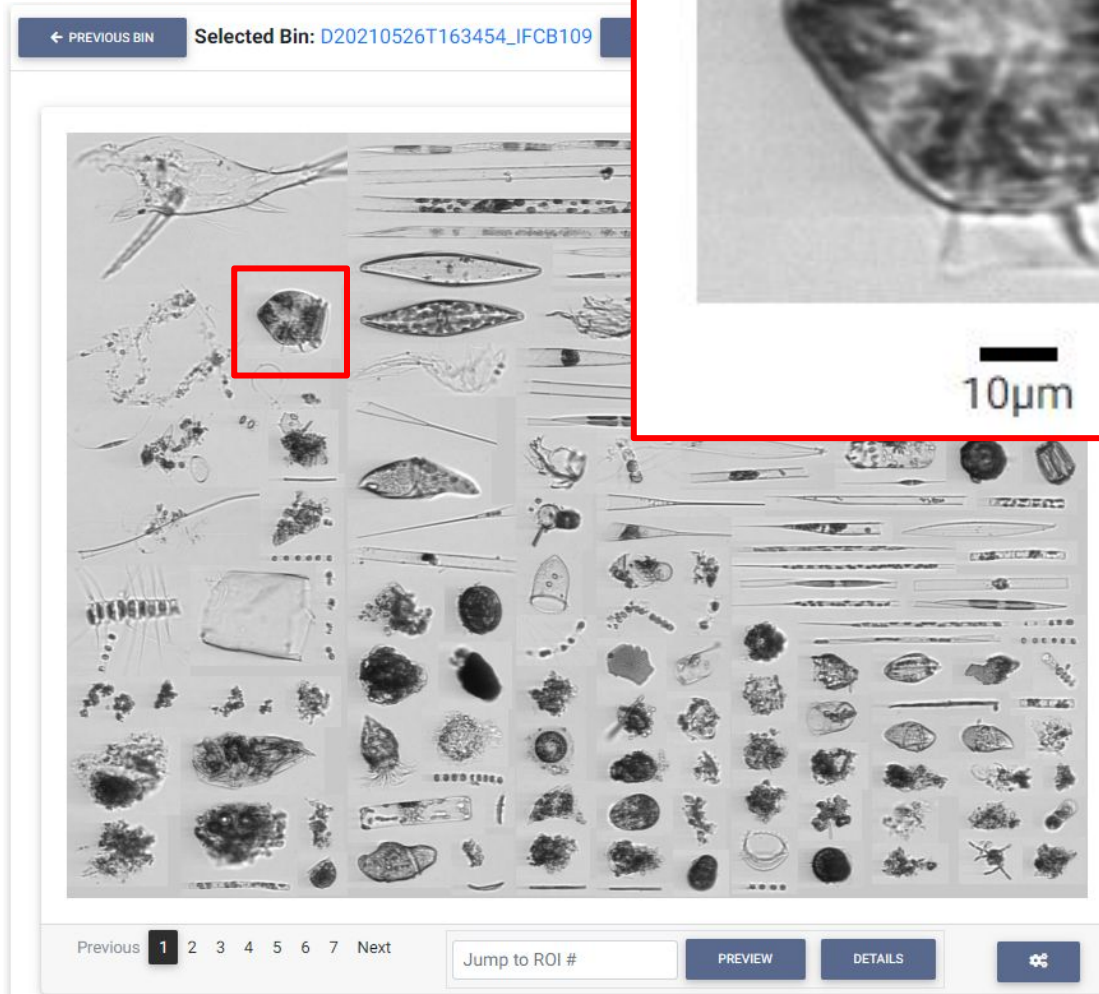

- **Explain the uncertainty of an image-based identification:**

- [identificationQualifier](#)

- select Open Nomenclature (ON) sign from [flowchart](#)

[Horton et al. \(2021\)](#)

Example

D20210526T163454_IFCB109_00469

Dinophysis_norvegica

(no manual annotation)

Dinophysis

[urn:lsid:marinespecies.org:taxname:109462](https://marinespecies.org/taxname/109462)

- identificationVerificationStatus:
 - PredictedByMachine
- identificationQualifier:
 - stet.

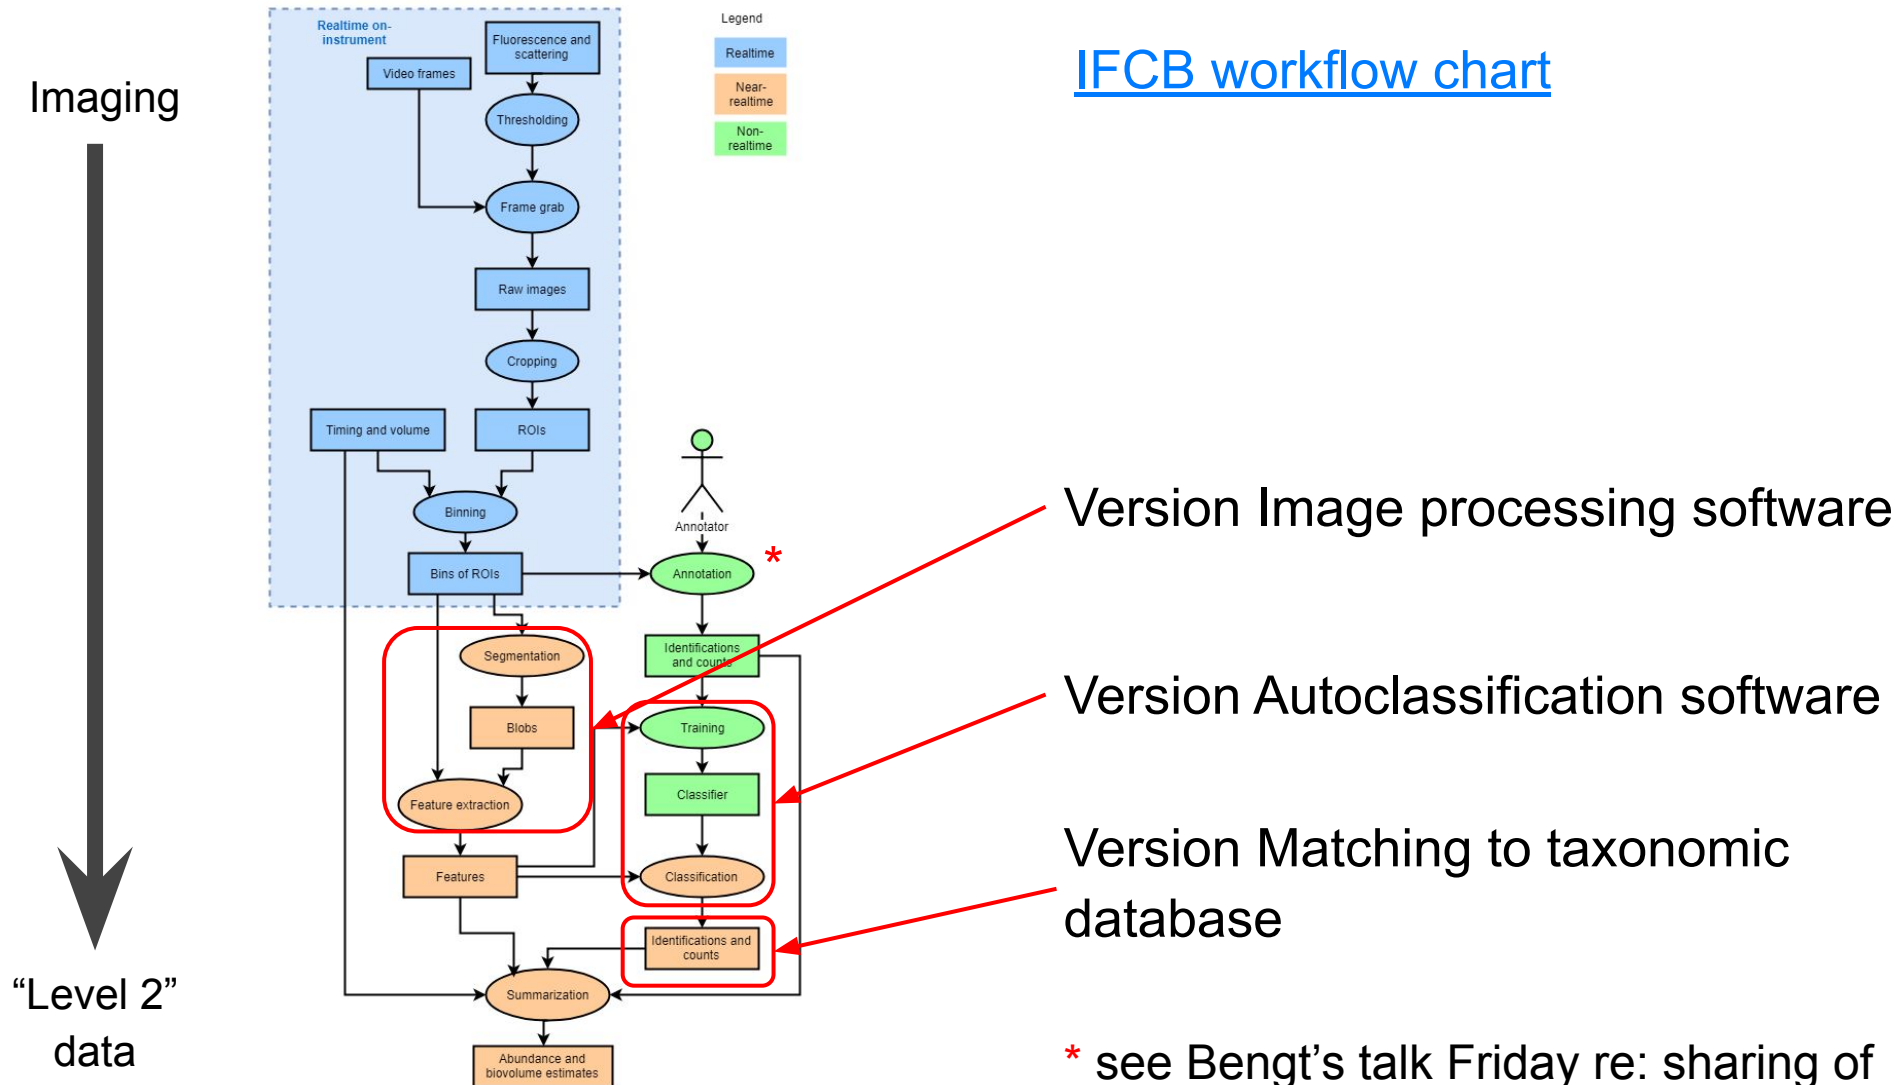

But what about Where? When?

Main points since we have limited time today:

- Data for the Which, Where, and When tend to be generated and stored in different infrastructure, thus we often need a workflow to pull together these data
- Quick tutorials from recent OBIS-USA [bio mobilization workshop](#) for:
 - Where? See “Getting lat/lon to decimal degrees”
 - When?: See “Getting your dates in order”
- EurOBIS template highly recommends including depth*

* OBIS does not require minimumDepthInMeters or maximumDepthInMeters

When? Not just when sample was collected...

[IFCB workflow chart](#)

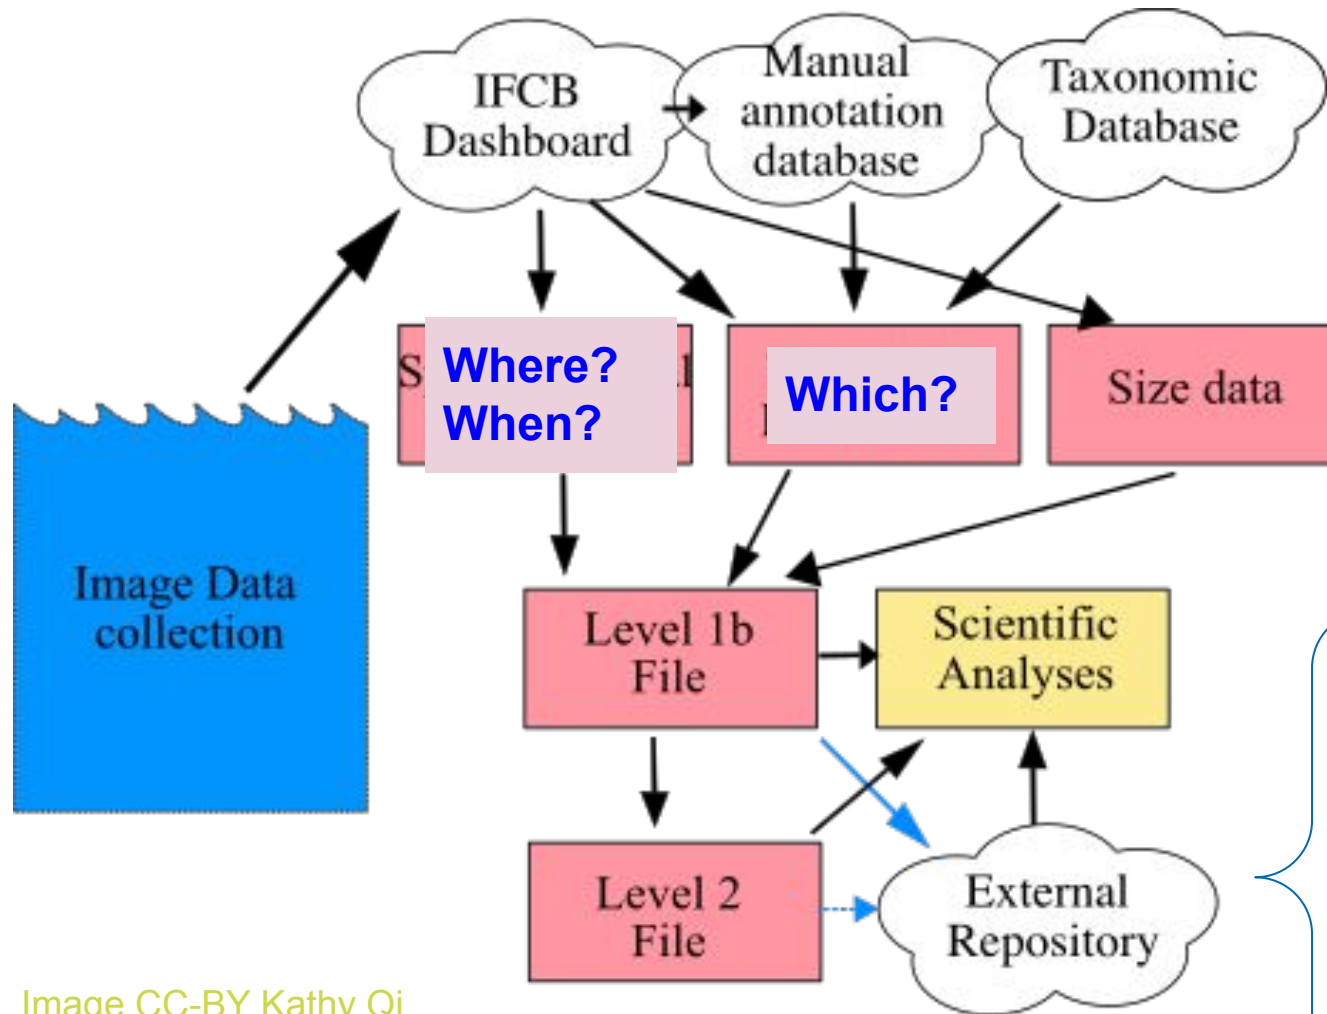

Version Image processing software

Version Autoclassification software

Version Matching to taxonomic database

* see Bengt's talk Friday re: sharing of annotated images for classifier development

Example for IFCB published in community repository

[Image CC-BY Kathy Qi](#)

[Sosik, H., et al. \(2020\)](#) Abundance and biovolume of taxonomically-resolved phytoplankton and microzooplankton imaged continuously underway with an Imaging FlowCytobot along the NES-LTER Transect in winter 2018 ver 1. Environmental Data Initiative.

Example for IFCB to OBIS

[IFCB OBIS with manual annotation.ipynb](#)

- Jupyter Notebook with code in Python
- prototype for testing purposes
- output tables for Darwin Core Archive package*

```
Out[15]:
```

occurrenceID	verbatimIdentification	identifiedBy	scientificNameID	scientificName	kingdom	eventID
D20180406T033616_IFCB115_00003_Bacillariophyceae	Bacillariophyceae	hsosik	urn:lsid:marinespecies.org:taxname:148899	Bacillariophyceae	Chromista	D20180406T033616_IFCB115

D20180406T033616_IFCB115_00016_Euglena	Euglena	hsosik	urn:lsid:marinespecies.org:taxname:8012	Euglena	Protozoa	D20180406T033616_IFCB115
D20180406T033616_IFCB115_00019_Chaetoceros	Chaetoceros	kkenitz	urn:lsid:marinespecies.org:taxname:148985	Chaetoceros	Chromista	D20180406T033616_IFCB115

* include Event and Occurrence (not yet Extended Measurement or Fact)

In summary: Sharing data products from automated *in situ* observations of plankton

- **Standardizing will help make your data FAIR (Interoperable and Reusable)**
- **Consider using the Darwin Core standard used by OBIS and GBIF**
 - Refer to best practices [links in previous slides]
 - Refer to OBIS and GBIF manuals
 - Tutorials from OBIS workshops
 - Join a community of practice, such as [Standardizing Marine Bio Data \(SMBD\) Working Group](#)
